

GPS MONITOR™

integratedUMS
for EnterpriseBusinesses

24

GPSmonitor allows you to track your personnel working out-of-office, no matter if they are moving in a car, on a bike or on a horseback. They may mutually communicate with the dispatching, download maps, send actual photos or search for other collaborators around them. Get better results thanks to a perfect controllership and fast communication with all your staff. You will increase both productivity and safety during outdoor tasks.

other integratedUMS components

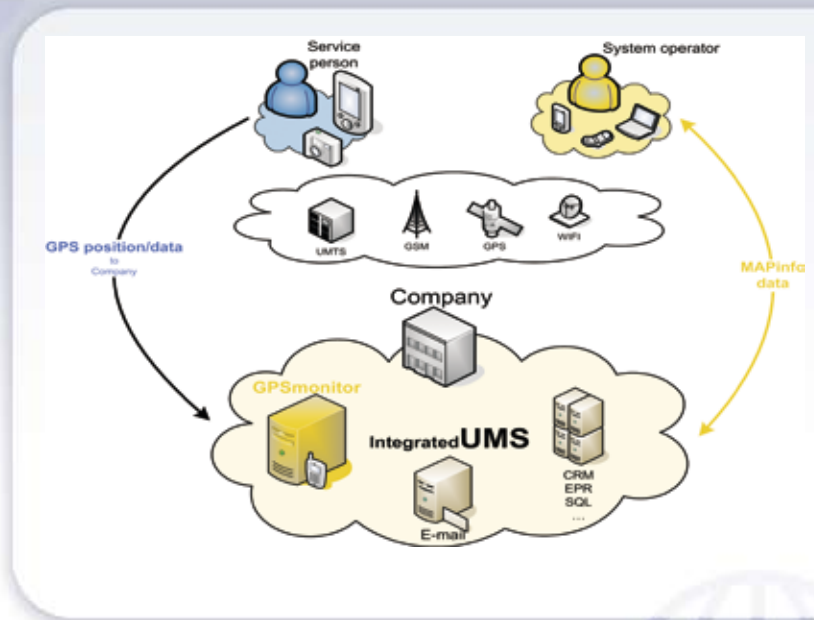

integratedUMS for EnterpriseBusinesses

GPSmonitor enables to track and trace your personnel working outdoors, as well as an effective message transfer among them and with their dispatching.

GPSmonitor is tracking directly the person equipped with a mobile device. It is very easy to track, trace and manage people walking, on bikes or in cars. GPSmonitor is a perfect tool not only for the Police including horse guards, security agencies, energetic controllers, medicals or messengers.

The mobile device facilitates your life:

- **Work with maps** – download a map of your surroundings from internet in a scale according to your needs; visualize already downloaded maps.
- **Messages for dispatching** – you may add a picture made by an inbuilt camera to your message.
- **Messages from dispatching** – pictures or plans may be added to text messages.
- **Information queries according to clients needs** – Database of stolen vehicles or documents may be downloaded, as well as car insurance database. Other functions may be easily added according to your request. Direct notifications or messages to clients systems are also possible.
- **Search for other mobile devices** – commander module. If this function is allowed, the user may easily track from his mobile phone the personnel equipped with mobile devices. He will get a map with coordinates and information about last log-in. The commander may also download a map to accompany the coordinates.

Supervisor module provides these functions:

- **Map visualization with localization** of mobile devices. If the device stops to localisate itself, last recorded position will be highlighted and shows last communication time.
- **Tracking and tracing of selected devices** (pathfinder module).
- **Replay of device motion from the register** („replay”) – enables, for example, to track precisely the motion and actions of a police officer after grievances of citizens.
- **Visualization of messages and pictures** received from mobile devices. Every picture or messages may be accompanied by an exact position or coordinates on the map from where it was sent. Attachments may be stored and further used.
- **Messages to mobile devices:** pictures or plans may be added to text messages.
